'Karplus's tales of a turbulent graduate school experience at Caltech will inspire readers to muster fortitude when everything seems to be spinning out of control. Karplus balances rigorous scientific discussions with refreshing chapters expounding his passion for photography and gastronomy.' Nature Chemistry, May 2020 Nobel Laureate Martin Karplus was eight when his family fled Nazi-occupied Austria via Switzerland and France for the United States. He would later credit his life as a refugee as a decisive influence on his world view and approach to science. Spinach on the Ceiling is an autobiographical telling of Karplus' life story, and how it led him to win the Nobel Prize in Chemistry in 2013. The book captures pivotal moments in Martin's life — from his escape to Switzerland in 1938 shortly after Hitler's entrance into Austria; to memorable moments like when his parents gave him a microscope which opened his eyes to the wonders of science; to his education in New England and California; and his eventual scientific career which took him to England, Illinois, Columbia, Strasbourg, and Harvard. It relates how Martin's optimistic outlook and belief in his vision made it possible for him to overcome setbacks in his life, and turn a subject of study his colleagues considered a waste of time into a central part of chemistry and structural biology. It is his hope to inspire and aid young readers, in particular, to have a successful trajectory in their own lives. Although research and teaching have been his primary focus, he has traveled the world photographing people and places with a Leica IIIc and has had numerous exhibitions of the photographs. He has also enjoyed a lifelong interest in cooking and worked in some of the best restaurants in France and Spain.

The chapters are authored by leading, research active, international experts in the respective topics.

Predicting survival and other outcomes is increasingly being recognized as an important skill for palliative care physicians, internists, and other health care professionals who care for patients with advanced cancer at the end of life. There is much prognostic information available that is scattered throughout the palliative care and oncological literature but this is the first time it has been gathered systematically in one place. This book has 36 chapters divided into three sections. The first is an introductory section that deals with the principles of prognostication, including formulating the prediction and then communicating it. Topics such as statistical issues, evidence based medicine, and the ethics of prognostication are also covered. The second section addresses prognostication in fifteen specific cancers when they have reached the advanced stage. The third section deals with prognostication in patients with a variety of common clinical conditions at the end of life, such as bowel obstruction, hypercalcemia, and brain metastases.

In the last decades, several in vitro and in vivo studies have revealed the existence of a very complex network between the neuroendocrine and immune system. Important molecular mechanisms underlying these interactions, in both physiological and pathological conditions, have also been described. Indeed, hormones play a pivotal role in the development and functional regulation of the immune system – both innate and acquired responses. Immune system cells present specific hormone receptors and themselves produce some hormones, thus influencing hormone secretion. More recently, the modulation of hormone secretion has been attempted for treating associated autoimmune disorders, further supporting the strong interplay between the endocrine and immune system. Distinguished experts, who have published extensively in their fields, have contributed comprehensive chapters to this volume. The focus is on the various aspects of endocrine-neuro-immune connections, providing an updated panorama - from basics to clinical applications - of current knowledge and still debated issues.

Uric acid disorders are involved in both nephrological and hematological diseases. One of these crystal-associated diseases which has been known since antiquity is gout. More recently, tumor Lysis syndromes have been identified which affect patients with cancer, especially in the phase of cellular destruction after chemotherapy. The detection of these hyperuricemic syndromes,

together with the improved understanding of urate handling by the kidney, have spurred new interest in the pathophysiology of hyperuricemic states, their clinical consequences and management. Moreover, the recent development of a recombinant form of urate oxidase transforming uric acid into allantoin (Rasburicase) has caused new interest in the pathophysiology of hyperuricemia and the potential applications of this new drug. The multidisciplinary approach of this book offers new insights into the metabolic syndromes in question by uniting authors from the fields of biochemistry, pharmacology, rheumatology, onco-hematology, and nephrology. The result is a compendium of the present knowledge in the field, which will also be very useful as a reference tool for professionals and students who want to expand their knowledge on this topic.

This book provides a comprehensive and up-to-date review of all aspects of childhood Acute Lymphoblastic Leukemia, from basic biology to supportive care. It offers new insights into the genetic pre-disposition to the condition and discusses how response to early therapy and its basic biology are utilized to develop new prognostic stratification systems and target therapy. Readers will learn about current treatment and outcomes, such as immunotherapy and targeted therapy approaches. Supportive care and management of the condition in resource poor countries are also discussed in detail. This is an indispensable guide for research and laboratory scientists, pediatric hematologists as well as specialist nurses involved in the care of childhood leukemia.

Better therapy of acute leukemias depends ultimately on better understanding of the distinction between leukemic and normal progenitor cells. This hugely important new book describes the current knowledge of acute leukemia biology and discusses new classification systems that have arisen as a result of emerging insights into pathogenesis. Estey, Faderl and Kantarjian, who all work at the respected Anderson Cancer Center in Houston, Texas, USA, examine in detail advances in the treatment of particular types of acute leukemia. Their book also covers the management of acute leukemia in general as well as the development of new therapies. This book will be extremely useful to clinicians.

Intensive care is a rapidly changing area of medicine, and after four years from the 2nd edition the volume editors and authors have deemed necessary to update it. In the recent years, in fact, five new randomised controlled trials and five new meta-analyses demonstrate that selective decontamination of the digestive tract [SDD] is an antimicrobial prophylaxis to prevent severe infections of not only lower airways but also of blood. Additionally, SDD has been shown to reduce inflammation including multiple organ failure and mortality. An intriguing observation is the evidence that SDD using parenteral and enteral antimicrobials reduces rather than increases antimicrobial resistance. Moreover, a new chapter on microcirculation had been added. The volume will be an invaluable tool for all those requiring in depth knowledge in the ever expanding field of infection control.

This is the 13th edition of a book written for students and specialists who are interested in developing a fundamental understanding of pathology and treatment of hematologic diseases. The amount of knowledge required by hematologists to identify the best course of treatment for a patient in this field is changing rapidly and has fueled an explosion of new drugs that target pathways virtually unknown a decade ago. We are now also entering an era of effective immunotherapy for a variety of hematologic malignancies, but the long term outcomes and toxicities of these treatment approaches are still unknown. This first

edition in English is a significant novelty in the history of this work. Its underlying goals, however, remain the same of the first Italian edition: to help students and specialists understand the basis, treatment and management of hematologic diseases. This book is open access under a CC BY 4.0 license. This textbook, endorsed by the European Society for Blood and Marrow Transplantation (EBMT), provides adult and paediatric nurses with a full and informative guide covering all aspects of transplant nursing, from basic principles to advanced concepts. It takes the reader on a journey through the history of transplant nursing, including essential and progressive elements to help nurses improve their knowledge and benefit the patient experience, as well as a comprehensive introduction to research and auditing methods. This new volume specifically intended for nurses, complements the ESH-EBMT reference title, a popular educational resource originally developed in 2003 for physicians to accompany an annual training course also serving as an educational tool in its own right. This title is designed to develop the knowledge of nurses in transplantation. It is the first book of its kind specifically targeted at nurses in this specialist field and acknowledges the valuable contribution that nursing makes in this area. This volume presents information that is essential for the education of nurses new to transplantation, while also offering a valuable resource for more experienced nurses who wish to update their knowledge.

?This second edition ?provides a comprehensive view of consolidated and innovative concepts, in terms of both diagnosis and treatment. Written by leading international physicians and investigators, this book emphasizes the necessity of combining local and systemic treatments to achieve the objective of yielding higher cure rates and lower toxicities. Heavily updated from the previous edition, it highlights new surgery and radiotherapy techniques, disease awareness, patient quality of life, and comprehensive management. Head-and-neck cancers are a complex clinical entity and their response to treatment is also known to vary markedly in function of host-related factors. Notwithstanding the impressive progresses observed in the field of imaging, head and neck cancers are often diagnosed at a late stage and the presence of locally advanced disease in a significant number of patients implies the use of aggressive treatments in order to both ensure local disease control and reduce distant metastasis risks. In comparison with the first edition, Head and Neck Cancer, Second Edition provides a detailed update of innovative concepts in chemo- and bio-radiation, viral infection impact on tumor growth and response to treatment, and impact of tumor- and host-related factors on treatment outcome.

??This book examines sports doping from production and distribution, detection and punishment. Detailing the daily operations of the trade and its gray area as a semi-legal market, the authors cover important issues ranging from athletes most at risk to the role of organized crime in sports doping, and whether sports governing bodies are enabling the trade. Challenges for law enforcement and legislation, and efforts to control PED use in the worldwide sports community and among aspiring athletes, are also discussed in depth. The book's extensive research:

- Estimates the demand for performance-enhancing products.
- Traces the route from legal substances to illegal uses.
- Identifies classes of suppliers and their methods of operation.
- Tracks typical distribution systems from suppliers to users.
- Examines the economics of the market: prices, profits, revenue.
- Assesses the state of anti-doping law enforcement efforts.

Starting with an unprecedented case study in Italy, the intense scrutiny from one pivotal country yields a potential template for research and policy on a world scale. Doping and Sport makes solid contributions to the work of researchers in criminology and criminal justice, particularly with an interest in corruption, drug trafficking, and criminal networks; researchers in sports science and public health; and policymakers.

Blood Cells has been written with both the practising haematologist and the trainee in mind. It aims to provide a guide for use in the diagnostic haematology laboratory, covering methods of collection of blood specimens, blood film preparation and staining, the principles of manual and automated blood counts and the assessment of the morphological features of blood cells. The practising haematologist should find this book sufficiently comprehensive to be a reference source while, at the same time, the trainee haematologist and biomedical scientist should find it a straightforward and practical bench manual. "The Nation has lost sight of its public health goals and has allowed the system of public health to fall into 'disarray'," from *The Future of Public Health*. This startling book contains proposals for ensuring that public health service programs are efficient and effective enough to deal not only with the topics of today, but also with those of tomorrow. In addition, the authors make recommendations for core functions in public health assessment, policy development, and service assurances, and identify the level of government--federal, state, and local--at which these functions would best be handled.

The ambitious goal of this volume is to provide – in chapters written by accomplished scientists and experts in their field – a comprehensive overview of the currently available information related to the therapeutic utility of adult bone marrow-derived cells. With excitement generated almost daily about the possible uses of stem cells to treat human disease, but the controversy surrounding their use still raging, adult bone-marrow derived cells are more readily available, and have a staggering range of uses.

Primary Immunodeficiency Disorders: A Historic and Scientific Perspective provides a complete historical context that is crucial for students and researchers concerned with primary immunodeficiency. When researchers have a poor understanding of the way we arrived where we are in research, they can miss important points about a disease, or miss out on how to approach new diseases. This historical knowledge of research can assist greatly by showing how it was done in the past, demonstrating the successes and failures, so that it can be done better in the future. This book provides an understanding of the process going from clinical problem to lab and back to the clinic, based on historical experiences. Its chapters proceed from the discovery of the T and B cell lineages through the first BMT for immunodeficiency disorder; lab investigation and gene therapy for PID; the discovery of the gene for AT and its function; understanding cytokine defects; and many other stops along the way. Facilitates communication among physicians and other investigators concerned with immunological and inflammatory diseases Summarizes for the first time all the known facts from 60 years of primary immunodeficiency research, and teaches how an important field in medicine was established Provides stimulating discussions on developing new medical therapies Highlights the importance of studying humans to understand mechanisms of disease that affect humans

This innovative and highly praised book describes the visible and palpable anatomy that forms the basis of clinical examination. The first chapter considers the anatomical terms needed for precise description of the parts of the body and movements from the anatomical positions. The remaining chapters are regionally organised and colour photographs demonstrate visible anatomy. Many of the photographs are reproduced with numbered overlays, indicating structures that can be seen, felt, moved or listened to. The surface markings of deeper structures are indicated together with common sites for injection of local anaesthetic, accessing blood vessels, biopsying organs and making incisions. The accompanying text describes the anatomical features of the illustrated structures. Over 250 colour photographs with accompanying line drawings to indicate the position of major structures. The seven regionally organised chapters cover all areas of male and female anatomy. The text is closely aligned with the illustrations and highlights the relevance for the clinical examination of a patient. Includes appropriate radiological images to aid understanding. All line drawings now presented in colour to add clarity and improve the visual interpretation. Includes 20 new

illustrations of palpable and visible anatomy. Revised text now more closely tied in with the text and with increasing emphasis on clinical examination of the body.

In the age of digitization our society is transformed into a new state. In particular, machine intelligence dramatically elevates our capability to create and digest information. Naturally, healthcare is also impacted by this trend and will even be more transformed into an informatic driven discipline in the future. In the most important area of histo-pathology, the interpretation of tissue slices from cancer patients, informatics will have an early and huge impact on treatment decisions and probably will act as the leading discipline for this transformation in medicine. Tissue Phenomics provides a comprehensive methodology aiming at the discovery of the most accurate tissue-based decision support algorithm by close integration of assay development, image analysis and bioinformatics, and optimization feedback loops. In this book the methodology of Tissue Phenomics and its benefits and wealth's are described. The different components of Tissue Phenomics are explained in the different chapters. In the chapters 2 to 4 of this book different authors describe various approaches on how to convert the wealth of tissue slide pixel data into mineable information using knowledge-based and data-driven image analysis methods. Subsequently, the datafication of images and the bioinformatics part plays a crucial role in generating prognostic and predictive models for disease progression. The integration of other data sources such as genomics, radiomics and patient related information is also important and is described as well. As discussed in chapters 5 and 6, these models may classify patients in distinct groups such as those responding to a given therapy. Since Tissue Phenomics provides a huge set of potentially prognostic features (phenes), one focus of both chapters is robust feature selection methods by advanced Monte-Carlo cross validation algorithms. In chapter 7 we discuss multiple application examples of Tissue Phenomics in academic and commercial settings and its tremendous impact to advances in biomedical sciences. Building on the successes in research, chapters 8 and 9 discuss applications in clinical environments and provide a flavor to the future envision in chapter 10, where tissue datafication and subsequent patient profiling is part of every routine examination, with the goal to best match patients with the most successful therapy, as predicted by tissue phenes.

This book discusses the most important practical aspects involved in providing multidisciplinary Adolescent and Young Adult (AYA) services for cancer patients. It draws on international experience in several continents of establishing and running such services and provides a contemporary, practical approach to AYA care based on accumulated experience. It is of interest to those establishing or seeking to improve AYA services as well as those already caring for AYA cancer patients. Among topics discussed are incidence trends and treatment pathways, access to clinical trials for adolescents, transition from pediatric to adult services, psychological support and social care as well as survivorship and fertility. This book is of value of those establishing new services, those developing an existing service and those whose work includes the care of AYA patients. It is an important companion for pediatricians, oncologists as well as other medical, nursing and allied health professionals caring for Adolescents and Young Adults with cancer.

Offers clear and concise instruction on running, reporting and interpreting immunophenotyping studies Written by two well-known haematology educators and experts on the topic, Immunophenotyping for Haematologists contains an introduction to running, reporting and interpreting immunophenotyping studies. The book offers a unique approach to the topic by putting the focus on clinical and laboratory haematologists who are not routinely involved in running and reporting on immunophenotyping studies. Immunophenotyping using flow cytometry has become the method of choice in identifying and sorting cells within complex populations, for example, the analysis of immune or neoplastic cells in a blood sample. The text reviews the purpose and principles of immunophenotyping and includes an introduction and explanation of the principles and the role of immunophenotyping. The authors examine immunophenotypic characteristics of the disease groups commonly encountered and identify the features that differentiate malignant cells from normal cells. To enhance understanding, the book contains multiple choice and extended matching questions which integrates immunophenotyping with clinicopathological features and the results of other investigations to mimic everyday practice. This important book: Provides a concise introduction to running, reporting and interpreting immunophenotyping studies Contains a list of all the antibody specificities currently widely used in diagnosis and disease monitoring Presents an ideal reference for use in laboratories, including immunophenotyping laboratories Aids in the interpretation by covering immunophenotypic characteristics of commonly encountered disease groups Identifies the features that differentiate malignant cells from their normal counterparts Written for haematologists working in both laboratory and clinical haematology, Immunophenotyping for Haematologists is a much-needed reference for understanding and interpreting immunophenotyping studies.
