The studies in this special issue of VIRUS GENES provide information on the mechanisms by which viruses have evolved together with their natural hosts by acquiring RNA and DNA molecules from the infected cells into their genomes. Part A is devoted to studies on virus genes that were acquired to evade the vertebrate host immune system. Part B deals with the acquisition of cellular and foreign virus genes by Herpes and Irido viruses. The studies presented in Part C describe the poxvirus genes that are homologues of cellular genes. Together, these studies provide an insight into the evolutionary processes that viruses have developed to control the metabolic machinery of the infected tissue cells, and to prevent the defense machinery of the infected host, e.g., the immune system, from recognizing the infecting virus. Such mechanisms may explain the pathogenicity and reflect the virulence of viruses. Molecular Evolution of Viruses - Past and Present: Evolution of Viruses by Acquisition of Cellular RNA and DNA was preceded by two VIRUS GENES special issues on the evolution of viruses (VIRUS GENES 11:2/3, 1996, and VIRUS GENES 16:1, 1998). The first special issue dealt with the evolution of retransposons, retroelements, retroviruses and endogenous retroviruses and current evolution of viruses. The second special issue provided information on the evolution of human, marine algae and fungal viruses. These issues, together with the third special issue on virus evolution, provide an interesting insight into the evolution of DNA and RNA viruses.

Collectively autoimmune diseases constitute a major burden to society. Though the etiology of autoimmune diseases remain largely unknown, evidence supports a substantial genetic component. For many autoimmune diseases, twin studies demonstrate a dramatically higher disease concordance rate in monozygotic twins than in dizygotic twins. Genes in the major histocompatibility complex (MHC) region on the short arm of chromosome 6, particularly the human leukocyte antigen (HLA) class II genes, are strongly associated with risk of developing rheumatoid arthritis (RA), systemic lupus erythematosus (SLE), multiple sclerosis (MS) and type 1 diabetes (T1D). The MHC class II transactivator gene (CIITA, also called MHC2TA), located on the short arm of chromosome 16, encodes an important transcription factor (CIITA) regulating the genes required for HLA class II MHC-restricted antigen presentation. Thus CIITA is a strong biological candidate for studies of autoimmune disease. Directly adjacent to CIITA lies the C-type lectin domain family 16, member A gene (CLEC16A, previously called KIAA0350). CLEC16A is a sugar binding receptor containing a putative immunoreceptor and was recently identified as a novel T1D and MS susceptibility locus through genomewide association (GWA) studies. HLA may also influence susceptibility to autoimmune disease through other inherited and noninherited mechanisms, in addition to genetic transmission of risk alleles. Evidence

for increased maternal-offspring HLA compatibility and differences in both maternal vs. paternal transmission rates (parent-of-origin effects) and nontransmission rates (noninherited maternal antigen (NIMA) effects) in autoimmune diseases have been reported. The investigation described in this dissertation tested hypotheses that (1) the CIITA -168A/G promoter polymorphism (rs3087456) influences susceptibility to RA (Chapter 2); (2) common genetic variation in CIITA influences susceptibility to RA in a case-control study (Chapter 3); (3) common genetic variation in CIITA influences susceptibility to SLE or specific secondary SLE phenotypes (Chapter 4); (4) common genetic variation in CIITA influences susceptibility to MS (Chapter 5); (5) common genetic variation in CLEC16A influences susceptibility to RA (Chapter 6); (6) the HLA class II DRB1 locus influences susceptibility to SLE through maternal-offspring HLA compatibility, parent-of-origin and NIMA effects (Chapter 7); and (7) the HLA classical loci influence susceptibility to T1D through maternal-offspring HLA compatibility, parent-of-origin and NIMA effects (Chapter 8). This dissertation includes the first study to fully characterize common genetic variation in CIITA and CLEC16A, including assesment of haplotypes, sex-specific effects, secondary clinical phenotypes and HLA risk alleles. Results do not provide evidence for association between CIITA and RA or SLE or for association between CLEC16A and RA. Interestingly, this study revealed evidence for an association between the CIITA missense mutation rs4774 and increased risk for MS in the presence of the

HLA-DRB1*1501 risk allele. There was no linkage disequilibrium between CIITA and CLEC16A, and the observed association between CIITA and MS in the presence of HLA-DRB1*1501 was independent of the association between CLEC16A and MS. The first studies to examine maternal-offspring HLA compatibility in T1D and HLA-DRB1 parent-of-origin and NIMA effects in SLE, and the largest study to examine maternal-offspring HLA compatibility in SLE and HLA parent-of-origin and NIMA effects in T1D were also performed. No evidence that the HLA-DRB1 locus influences risk for SLE or that the classical HLA loci influence risk for T1D through these novel biological phenomena was revealed.

During the past decade there has been an explosion in computation and information technology. With it have come vast amounts of data in a variety of fields such as medicine, biology, finance, and marketing. The challenge of understanding these data has led to the development of new tools in the field of statistics, and spawned new areas such as data mining, machine learning, and bioinformatics. Many of these tools have common underpinnings but are often expressed with different terminology. This book describes the important ideas in these areas in a common conceptual framework. While the approach is statistical, the emphasis is on concepts rather than mathematics. Many examples are given, with a liberal use of color graphics. It should be a valuable resource for statisticians and anyone interested in data mining in science or industry. The book's coverage is broad, from supervised learning (prediction) to unsupervised learning. The many topics include neural networks, support vector machines, classification trees and boosting---the first comprehensive treatment of this topic in any book. This major new edition features many topics not covered in the original,

including graphical models, random forests, ensemble methods, least angle regression & path algorithms for the lasso, non-negative matrix factorization, and spectral clustering. There is also a chapter on methods for “wide” data (p bigger than n), including multiple testing and false discovery rates. Trevor Hastie, Robert Tibshirani, and Jerome Friedman are professors of statistics at Stanford University. They are prominent researchers in this area: Hastie and Tibshirani developed generalized additive models and wrote a popular book of that title. Hastie co-developed much of the statistical modeling software and environment in R/S-PLUS and invented principal curves and surfaces. Tibshirani proposed the lasso and is co-author of the very successful *An Introduction to the Bootstrap*. Friedman is the co-inventor of many data-mining tools including CART, MARS, projection pursuit and gradient boosting.

The second edition of this book on lipids, lipoprotein and membrane biochemistry has two major objectives - to provide an advanced textbook for students in these areas of biochemistry, and to summarise the field for scientists pursuing research in these and related fields. Since the first edition of this book was published in 1985 the emphasis on research in the area of lipid and membrane biochemistry has evolved in new directions. Consequently, the second edition has been modified to include four chapters on lipoproteins. Moreover, the other chapters have been extensively updated and revised so that additional material covering the areas of cell signalling by lipids, the assembly of lipids and proteins into membranes, and the increasing use of molecular biological techniques for research in the areas of lipid, lipoprotein and membrane biochemistry have

been included. Each chapter of the textbook is written by an expert in the field, but the chapters are not simply reviews of current literature. Rather, they are written as current, readable summaries of these areas of research which should be readily understandable to students and researchers who have a basic knowledge of general biochemistry. The authors were selected for their abilities both as researchers and as communicators. In addition, the editors have carefully coordinated the chapters so that there is little overlap, yet extensive cross-referencing among chapters.

As the molecular basis of human disease becomes better characterized, and the implications for understanding the molecular basis of disease becomes realized through improved diagnostics and treatment, *Molecular Pathology, Second Edition* stands out as the most comprehensive textbook where molecular mechanisms represent the focus. Our Genes, Our Choices: How Genotype and Gene Interactions Affect Behavior - First Prize winner of the 2013 BMA Medical Book Award for Basic and Clinical Sciences - explains how the complexity of human behavior, including concepts of free will, derives from a relatively small number of genes, which direct neurodevelopmental sequence. Are people free to make choices, or do genes determine behavior? Paradoxically, the answer to both questions is "yes," because of neurogenetic individuality, a new theory with profound implications. Author David Goldman uses judicial, political, medical, and ethical examples to illustrate that this lifelong process is guided by individual genotype, molecular and physiologic principles, as well as by randomness and environmental exposures, a combination of factors that we choose and do not

Written in an authoritative yet accessible style, the book includes practical descriptions of the function of DNA, discusses the scientific and historical bases of genetics, and introduces topics of epigenetics and the predictive power of behavioral genetics. First Prize winner of the 2013 BMA Medical Book Award for Basic and Clinical Sciences Poses and resolves challenges to moral responsibility raised by modern genetics and neuroscience Analyzes the neurogenetic origins of human behavior and free will Written by one of the world's most influential neurogeneticists, founder of the Laboratory of Neurogenetics at the National Institutes of Health

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this

extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

The purpose of this manual is to provide an educational genetics resource for individuals, families, and health professionals in the New York - Mid-Atlantic region and increase awareness of specialty care in genetics. The manual begins with a basic introduction to genetics concepts, followed by a description of the different types and applications of genetic tests. It also provides information about diagnosis of genetic disease, family history, newborn screening, and genetic counseling. Resources are included to assist in patient care, patient and professional education, and identification of specialty genetics services within the New York - Mid-Atlantic region. At the end of each section, a list of references is provided for additional information. Appendices can be copied for reference and offered to patients. These take-home resources are critical to helping both providers and patients understand some of the basic concepts and applications of genetics and genomics.

Well aware of Jews having once been the victims of Nazi eugenics policies, many Jews today have an ambivalent attitude toward new genetics and are understandably wary of genetic forms of identity and intervention. At the

same time, the Jewish tradition is strongly committed to medical research designed to prevent or cure diseases. *Jews and Genes* explores this tension against the backdrop of various important developments in genetics and bioethics—new advances in stem cell research; genetic mapping, identity, testing, and intervention; and the role of religion and ethics in shaping public policy. *Jews and Genes* brings together leaders in their fields, from all walks of Judaism, to explore these most timely and intriguing topics—the intricacies of the genetic code and the wonders of life, along with cutting-edge science and the ethical issues it raises.

Original and interdisciplinary, this is the first book to explore the relationship between a neoliberal mode of governance and the so-called genetic revolution. Looking at the knowledge-power relations in the post-genomic era and addressing the pressing issues of genetic privacy and discrimination in the context of neoliberal governance, this book demonstrates and explains the mechanisms of mutual production between biotechnology and cultural, political, economic and legal frameworks. In the first part Antoinette Rouvroy explores the social, political and economic conditions and consequences of this new 'perceptual regime'. In the second she pursues her analysis through a consideration of the impact of 'geneticization' on political support of the welfare state and on the operation of private health and life insurances. Genetics and neoliberalism, she argues, are complicit in fostering the belief that social and economic patterns have a fixed nature beyond the reach of democratic deliberation, whilst the characteristics of individuals are unusually plastic, and within the scope of individual choice and responsibility. This book will be of interest to all students of law, sociology and politics.

Genes, Brain Function, and Behavior offers a concise description of the nervous system that processes sensory input and initiates motor movements. It reviews how behaviors are defined and measured, and how experts decide when a behavior is perturbed and in need of treatment. Behavioral disorders that are clearly related to a defect in a specific gene are reviewed, and the challenges of understanding complex traits such as intelligence, autism and schizophrenia that involve numerous genes and environmental factors are explored. New methods of altering genes offer hope for treating or even preventing difficulties that arise in our genes. This book explains what genes are, what they do in the nervous system, and how this impacts both brain function and behavior. Presents essential background, facts, and terminology about genes, brain function, and behavior Builds clear explanations on this solid
